

After coffee is harvested and processed, it is sent all around the world to be roasted. This is when the green coffee seed is turned from green to brown and becomes soluble (this means you can dissolve parts of it in water). To roast the coffee a trained person called a roaster will use a big machine (that is usually powered by gas).

This is a roaster. It is used to turn raw green coffee beans into brown roasted ones

Roasted coffee beans

Once the coffee beans are roasted, they can be ground up (using a grinder) and then brewed into a cup of coffee
